

Cultural Heritage Research & AI Quality Review Intern

Ariadne Cultural Travel Platform — Internship Job Description

Position Overview

Ariadne is developing an AI-assisted cultural travel platform designed to help visitors discover and experience the most important museums, artworks, historic sites, architecture, archaeological sites, gardens, and cultural landscapes around the world. The project is building a structured database covering 800+ museums and cultural heritage destinations, together with visitor-oriented maps and curated routes.

Project Outputs

- First Visit / Essential Routes
- One-hour, two-hour, half-day, and other time-limited routes
- Thematic routes (for example, Impressionism, Chinese Art, architecture, or ancient civilizations)
- Family and children's routes
- Interest-based routes
- City cultural maps and museum/site maps

Position Purpose

The intern serves as a human research and quality-control reviewer within an AI-assisted cultural heritage workflow. AI conducts large-scale candidate discovery, metadata organization, preliminary evaluation, and self-audit. Interns focus on the cases where human judgment adds the greatest value: S-Tier candidates, S/A boundary cases, uncertain evaluations, conflicting evidence, and objects flagged Research Needed.

Central question: If someone visits this museum or heritage site for the first time, what should they make sure they experience—and why?

Primary Responsibilities

- Review AI-generated preliminary Tier evaluations and supporting evidence.
- Review all assigned S-Tier and important S/A boundary candidates.
- Investigate objects flagged Research Needed.
- Resolve cases where the AI's initial evaluation and independent audit disagree.
- Identify important objects that may have been underestimated because of incomplete metadata.
- Identify objects that may have been overestimated because of promotional, weak, or insufficient evidence.
- Verify important factual claims using authoritative sources.
- Conduct targeted research to answer narrow unresolved questions rather than restarting each object from zero.
- Recommend Confirm, Upgrade, Downgrade, or Further Review Needed.

- Document concise reasons for material changes.
- Help identify recurring AI errors so the Ariadne methodology can improve over time.

Ariadne Tier Framework

Tier	Visitor Meaning
S — Essential / Must See	One of the defining experiences of a first visit.
A — Highly Recommended	Important and strongly recommended when time permits.
B — Worth Seeing	Valuable but generally secondary to S/A for a first visit.
C — Supplementary / Specialized	Primarily useful for deeper, specialized, or interest-specific visits.

Tier is destination-contextual. A regional museum may have its own S-Tier objects; this does not imply equal absolute world-historical importance to masterpieces at major global institutions.

Human Review Workflow

1. Read the AI review card: object information, key evidence, sources, Preliminary Tier, Audit Tier, confidence, missing evidence, and research question.
2. Determine whether the existing evidence is sufficient. Do not restart the research from zero unless necessary.
3. If research is needed, answer the specific unresolved question using authoritative sources.
4. Separate externally verifiable FACT from interpretation or Ariadne judgment.
5. Recommend Confirm, Upgrade, Downgrade, or Further Review Needed.
6. Record a concise reason code or explanation for any material change.

Preferred Research Sources

7. Official museum or heritage-site databases and websites
8. Official museum catalogues and collection publications
9. UNESCO and government cultural-heritage authorities
10. Scholarly books and exhibition catalogues
11. Peer-reviewed scholarship
12. University and authoritative academic databases
13. Reputable specialist sources when stronger sources are unavailable

General websites may help locate information but should not normally be the sole evidence for an important S/A judgment. Students should never manufacture evidence to fill a database field. 'Unknown' is an acceptable research conclusion.

Special Review of S-Tier Objects

- If a first-time visitor had only two hours, should this still be included?
- Would leaving without seeing it constitute a meaningful missed experience?
- Is it one of the strongest ways for a visitor to understand or remember this museum or heritage site?
- Does the S judgment remain convincing after unsupported AI interpretation is removed?

What Interns Are Not Expected to Do

- Manually research every B and C object.
- Write long essays about every artwork or site.
- Rewrite descriptions simply to make them longer.
- Accept AI conclusions without checking important evidence.
- Rank objects solely according to personal taste or fame.
- Treat UNESCO designation as automatically producing an S rating.
- Resolve uncertainty by guessing.

Additional Project Opportunities

- Review First Visit and thematic routes.
- Test museum floor maps and spatial accuracy.
- Review family and interest-based routes.
- Compare AI-generated routes with actual museum visits.
- Evaluate gallery/zone rankings against the quality of objects within them.
- Identify overlooked cultural destinations within major cities.
- Test Ariadne methodology across cultures and different types of heritage sites.

Ideal Candidates

Suitable fields include Art History, History, Archaeology, Anthropology, Museum Studies, Architecture, Cultural Heritage, Classics, Asian Studies, Religious Studies, Digital Humanities, Library/Information Science, and Data Science or AI with a humanities interest.

- Intellectual curiosity and interest in museums, cultural heritage, travel, or technology
- Careful research habits and attention to factual accuracy
- Ability to distinguish strong from weak sources
- Willingness to question AI conclusions
- Ability to make concise, evidence-based judgments
- Specialist knowledge of every culture or artistic tradition is not required

Learning Outcomes

- Critically evaluate AI-generated cultural research
- Conduct targeted scholarly research
- Assess source quality and evidence confidence
- Separate evidence from interpretation
- Work with structured cultural-heritage metadata
- Evaluate objects in institutional and visitor context
- Participate in human-in-the-loop AI quality assurance
- Understand how research data becomes maps, routes, and a visitor-facing digital product

How Student Work Fits the Product

AI Research → Human Review → Final Tier → City/Museum Map → First Visit & Thematic Routes → Ariadne App

The internship emphasizes quality of judgment rather than quantity of prose. Student review directly improves the reliability of the visitor-facing recommendations.
